

THE AIRCRAFT ENGINEER

$$\therefore \frac{y}{d} = \frac{d+b}{b+2d}$$
$$\therefore \frac{y}{d} = \frac{1+\frac{b}{d}}{1+2\left(\frac{d}{b}\right)} \dots \dots \dots (1)$$

$$I_{xx} = \frac{2}{3} \times td^3 + \frac{bt^3}{12} + tbd^2 - Ay^2$$
$$= t\left(\frac{2d^3}{3} + \frac{bt^2}{12} + bd^2\right) - Ay^2$$

Assume that t is small compared with b and d and neglect terms involving t^2 :—

Then $I_{xx} = t\left(\frac{2d^3 - 3bd^2}{3}\right) - Ay^2$
$$\therefore \frac{I_{xx}}{A} = \frac{2d^3 + 3bd^2}{3(b+2d)} - y^2$$
